of the internet.**

# MULTIGIG

**CONNECTION,  
there's nothing  
you can't do!**

From the rise in remote work to online gaming and the Internet of Things, today's customers need more bandwidth than ever before. Demand is only going to increase, and 1 Gbps speeds will soon become the bare minimum. Don't get left behind. The future is in multigig connections.

Think about how quickly technology has evolved. When wireless technology was first introduced in 1997, few could have guessed that Wi-Fi would commonly be used to control doorbells, refrigerators and even bathroom scales.

While just a decade ago many consumers operated off a 5-25 Mbps connection, fiber technology has made connections ranging from 100 Mbps to 1 Gbps the norm for most.

But with business and residential consumers requiring more bandwidth for their many internet-enabled devices every day, the need for multigig broadband connections is here now.
